Implement a New Graph

The BRAPH 2 Developers

August 14, 2024

This is the developer tutorial for implementing a new graph. In this tutorial, you will learn how to create the generator file `*.gen.m` for a new graph, which can then be compiled by `braph2genesis`. All graphs are (direct or indirect) extensions of the base element `Graph`. Here, you will use as examples the graphs `GraphBD` (Binary Directed graph), `MultilayerWU` (Weighted Undirected multilayer graph), `MultiplexBUT` (Binary Undirected multiplex at fixed Thresholds), and `OrdMxBUT` (Binary Undirected ordinal multiplex with fixed Thresholds).

Implementation of Unilayer Graphs

Unilayer Binary Directed Graph (GraphBD)

You will start by implementing in detail `GraphBD`, which is a direct extension of `Graph`. A unilayer graph is constituted by nodes connected by edges, where the can be either 0 (absence of connection) or 1 (existence of connection).

Code 1: **GraphBD element header.** The `header` section of the generator code in `_GraphBD.gen.m` provides the general information about the `GraphBD` element.

```
%% iheader!
GraphBD < Graph (g, binary directed graph) is a binary directed graph. (1)

%%% idescription! (2)
In a binary directed (BD) graph, the edges are directed and they can be
     either 0 (absence of connection) or 1 (existence of connection).

%%% ibuild! (3)
1
```

(1) defines `GraphBD` as a subclass of `Graph`. The moniker will be `g`.

(2) provides a description of this graph.

(3) defines the build number of the graph element.

Code 2: **GraphBD element prop update.** The `props_update` section of the generator code in `_GraphBD.gen.m` updates the properties of the `Graph` element. This defines the core properties of the graph.

```
%% iprops_update!

%%% iprop!
NAME (constant, string) is the name of the binary directed graph.
%%%% idefault!
'GraphBD'

%%% iprop!
DESCRIPTION (constant, string) is the description of the  binary directed
     graph.
%%%% idefault!
'In a binary directed (BD) graph, the edges are directed and they can be
     either 0 (absence of connection) or 1 (existence of connection).'

%%% iprop!
TEMPLATE (parameter, item) is the template of the  binary directed graph.

%%% iprop!
ID (data, string) is a few-letter code of the  binary directed graph.
%%%% idefault!
'GraphBD ID'

%%% iprop!
LABEL (metadata, string) is an extended label of the binary directed graph.
%%%% idefault!
'GraphBD label'

%%% iprop!
NOTES (metadata, string) are some specific notes about the binary directed
     graph.
```

```
%%%% idefault!
'GraphBD notes'

%%% iprop! (1)
GRAPH_TYPE (constant, scalar) returns the graph type __Graph.GRAPH__.
%%%% idefault!
Graph.GRAPH

%%% iprop! (2)
CONNECTIVITY_TYPE (query, smatrix) returns the connectivity type __Graph.
    BINARY__.
%%%% idefault!
value = Graph.BINARY;

%%% iprop! (3)
DIRECTIONALITY_TYPE  (query, smatrix) returns the directionality type
    __Graph.DIRECTED__.
%%%% idefault!
value = Graph.DIRECTED;

%%% iprop! (4)
SELFCONNECTIVITY_TYPE (query, smatrix) returns the self-connectivity type
    __Graph.NONSELFCONNECTED__.
%%%% idefault!
value = Graph.NONSELFCONNECTED;

%%% iprop! (5)
NEGATIVITY_TYPE (query, smatrix) returns the negativity type __Graph.
    NONNEGATIVE__.
%%%% idefault!
value = Graph.NONNEGATIVE;

%%% iprop! (6)
A (result, cell) is the binary adjacency matrix of the binary directed graph
    .
%%%% icalculate!
B = g.get('B'); (7)

B = dediagonalize(B);  (8)
B = semipositivize(B, 'SemipositivizeRule', g.get('SEMIPOSITIVIZE_RULE'));
    (9)
B = binarize(B); (10)

A = {B}; (11)
if g.get('RANDOMIZE') (12)
  random_A = g.get('RANDOMIZATION', A);
  A = {random_A};
end
value = A; (13)
%%%% igui! (14)
pr = PanelPropCell('EL', g, 'PROP', GraphBD.A, ...
  'TABLE_HEIGHT', s(40), ...
  'XSLIDERSHOW', false, ...
  'YSLIDERSHOW', false, ...
  'ROWNAME' , g.getCallback('ANODELABELS'), ...
  'COLUMNNAME', g.getCallback('ANODELABELS'));
```

(1) defines the *graph type*: `Graph.GRAPH` (single layer), `Graph.MULTIGRAPH` (multiple unconnected layers), `Graph.MULTILAYER` (multiple layers), `Graph.ORDERED_MULTILAYER` (multiple subsequent layers) `Graph.MULTIPLEX` (multilayer with connections between corresponding nodes), and `Graph.ORDERED_MULTIPLEX` (multilayer with connections between corresponding nodes in subsequent layers).

(2) defines the *graph connectivity*: `Graph.BINARY` (0 or 1) or `Graph.WEIGHTED`.

(3) defines the *edge directionality*: `Graph.DIRECTED` or `Graph.UNDIRECTED`.

(4) defines the *graph self-connectivity*: `Graph.NONSELFCONNECTED` or `Graph.SELFCONNECTED`.

(5) defines the *graph negativity*: `Graph.NONNEGATIVE` or `Graph.NEGATIVE`.

(6) The property `A` contains the supra-adjacency matrix of the graph, which is calculated by the code under `icalculate!`.

(7) retrieves the adjacency matrix of the graph `B`, defined in the new properties below.

(8), (9), and (10) condition the adjaciency matrix removing the diagonal elements, making it semidefinte positive, and binarizing it. A list of useful functions is: `diagonalize` (removes the off-diagonal), `dediagonalize` (removes the diagonal), `binarize` (binarizes with threshold=0), `semipositivize` (removes negative weights), `standardize` (normalizes between 0 and 1) or `symmetrize` (symmetrizes the matrix). Use the MatLab help to see additional functionalities.

(11) preallocates the adjacency matrix to be calculated.

(12) randomizes adjacency matrix when `'RANDOMIZE'` is `true` by calling the function of the graph named `RANDOMIZATION`

(13) returns the calculated graph `A` assigning it to the output variable `value`.

(14) employs the property panel `PanelPropCell` to be employed to visualize `A`, setting also its properties.

```
78
79 %%% iprop! (15)
80 COMPATIBLE_MEASURES (constant, classlist) is the list of compatible measures
       .
81 %%%% idefault!
82 getCompatibleMeasures('GraphBD')
```

(15) determines the list of compatible figures.

Code 3: **GraphBD element props.** The `props` section of the generator code in `_GraphBD.gen.m` defines the properties to be used in `GraphBD`.

```
1  %% iprops!
2
3  %%% iprop!(1)
4  B (data, smatrix) is the input graph adjacency matrix.
5  %%%% igui! (2)
6  pr = PanelPropMatrix('EL', g, 'PROP', GraphBD.B, ...
7    'TABLE_HEIGHT' , s(40), ...
8    'ROWNAME' , g.getCallback('ANODELABELS'), ...
9    'COLUMNNAME', g.getCallback('ANODELABELS'), ...
10   varargin{:});
11
12 %%% iprop! (3)
13 SEMIPOSITIVIZE_RULE (parameter, option) determines how to remove the
       negative edges.
14 %%%% isettings!
15 {'zero', 'absolute'}
16
17 %%% iprop!(4)
18 ATTEMPTSPEREDGE (parameter, scalar) is the attempts to rewire each edge.
19 %%%% idefault!
20 5
21
22 %%% iprop!(5)
23 RANDOMIZATION (query, cell) randomizes matrix contained in the cell.
24 %%%% icalculate!
25 rng(g.get('RANDOM_SEED'), 'twister')
26
27 if isempty(varargin) (6)
28   value = {};
29   return
30 end
31
32 A = cell2mat(varargin{1});
33 attempts_per_edge = g.get('ATTEMPTSPEREDGE');
34 % remove self connections
35 A(1:length(A)+1:numel(A)) = 0;
36 [I_edges, J_edges] = find(A);  (7)
37 E = length(I_edges); (8)
38
39 if E == 0 (9)
40   value = A;
41   swaps = 0;
42   return
43 end
44
45 if E == 1 (10)
46   r_ab = A(I_edges(1), J_edges(1));
```

(1) contains the input adjacency matrix `B`, which is typically weighted and directed.
(2) defines the property panel `PanelPropMatrix` to plot this property with a table.

(3) defines the semi-positivation rule (i.e., how to remove the negative edges) to be used when generating the adjacency matrix `A` from the intput property `B`. The admissible options are: `'zero'` (default, convert negative values to zeros) or `'absolute'` (convert negative values to absolute value).
(4) defines the number of attempts that will be used for each edge when calling `RANDOMIZATION`.
(5) randomizes the adjacency matrix contained in `cell`.

(6) returns empty cell is the input is an empty cell.

(7) finds number of edges in the matrix (different from zero).
(8) returns number of edges in the matrix (different from zero).
(9) returns same input matrix if it is all zeros.

(10) randomizes the edge when there is only one edge in the input matrix.

```
47    A(I_edges(1), J_edges(1)) = 0;
48    selected_nodes = randperm(size(A, 1), 2);
49    A(selected_nodes(1), selected_nodes(2)) = r_ab;
50    value = A;
51    swaps = 1;
52    return
53  end
54
55  random_A = A;
56  swaps = 0; % number of successful edge swaps
57  for attempt = 1:1:attempts_per_edge*E (11)
58
59    selected_edges = randperm(E,2); (12)
60    node_start_1 = I_edges(selected_edges(1));
61    node_end_1 = J_edges(selected_edges(1));
62    node_start_2 = I_edges(selected_edges(2));
63    node_end_2 = J_edges(selected_edges(2));
64
65    r_1 = random_A(node_start_1, node_end_1); (13)
66    r_2 = random_A(node_start_2, node_end_2);
67
68    if ~random_A(node_start_1, node_end_2) && ...
69    ~random_A(node_start_2, node_end_1) && ...
70    node_start_1~=node_start_2 && ...
71    node_end_1~=node_end_2 && ...
72    node_start_1~=node_end_2 && ...
73    node_start_2~=node_end_1
74
75      % erase old edges (14)
76      random_A(node_start_1, node_end_1) = 0;
77      random_A(node_start_2, node_end_2) = 0;
78
79      % write new edges (15)
80      random_A(node_start_1, node_end_2) = r_1;
81      random_A(node_start_2, node_end_1) = r_2;
82
83      % update edge list
84      J_edges(selected_edges(1)) = node_end_2;
85      J_edges(selected_edges(2)) = node_end_1;
86
87      swaps = swaps+1;
88    end
89  end
90  value = random_A;
```

(11) randomizes edges in the matrix when more than one edge (non-zero) were found in the input matrix.

(12) takes two random edges.

(13) saves the values of the selected random edges (this is important when the property `RANDOMIZATION` is used by weighted graphs).

(14) deletes edges in the old positions.

(15) sets values of edges in the new random positions.

Code 4: **GraphBD element tests.** The `tests` section in the element generator `_GraphBD.gen.m`. A general test should be prepared to test the properties of the graph when it is empty and full. Furthermore, additional tests should be prepared for the defined rules (one test per rule).

```
1  %% itests!
2
3  %%% iexcluded_props! (1)

'GraphBD Randomize is not functioning well.')
```

(21) tests that new random matrix is different from original one.

(22) tests that new random matrix has the same number of nodes as the original one

(23) tests that new random matrix has the same degree distribution as the original one

Implementation of Multilayer Graphs

Weigthed Directed Multilayer Graph (MultilayerWD)

You can now use `GraphBD` as the basis to implement the `MultilayerWD` graph. The parts of the code that are modified are highlighted. A multilayer graph allows connections between any nodes across the multiple layers, where all layers are interconnected following a categorical fashion.

Code 5: **MultilayerWD element header.** The `header` section of generator code in `_MultilayerWD.gen.m` provides the general information about the `MultilayerWD` element. ← Code 1

```
%% iheader!
MultilayerWD < Graph (g, multilayer weighted directed graph) is a multilayer
      weighted directed graph.

%%% idescription!
In a multilayer weighted directed (WD) graph, layers could have different
     number of nodes with within-layer weighted directed edges, associated
     with a real number between 0 and 1 and indicating the strength of the
     connection. The connectivity matrices are symmetric (within layer). All
      node connections are allowed between layers.

%%% ibuild!
1
```

Code 6: **MultilayerWD element prop update.** The `props_update` section of the generator code in `_MultilayerWD.gen.m` updates the properties of `MultilayerWD`. ← Code 2

```
%% iprops_update!

%%% iprop!
NAME (constant, string) is the name of the multilayer weighted directed
     graph.
%%%% idefault!
'MultilayerWD'

%%% iprop!

Binary Undirected Multilayer Graph with fixed Thresholds (MultiplexBUT)

Now you will implement the `MultiplexBUT` graph building on the previous codes `GraphBD` and `MultilayerWD`. Again, the differences will be highlighted. A multiplex graph is a type of multilayer graph where interlayer edges are allowed only between homologous nodes. In this case, the layers follow a categorical architecture, which means that all layers are interconnected.

Code 9: **MultiplexBUT element header.** The `header` section of the generator code in `_MultiplexBUT.gen.m` provides the general information about the `MultiplexBUT` element. ← Code 1

```
%% iheader!
MultiplexBUT < MultiplexWU (g, binary undirected multiplex with fixed
    thresholds) is a binary undirected multiplex with fixed thresholds. (1)

%%% idescription!
In a binary undirected multiplex with fixed thresholds (BUT), the layers are
     those of binary undirected (BU) multiplex graphs derived from the same
     weighted supra-connectivity matrices binarized at different thresholds
    .The supra-connectivity matrix has a number of partitions equal to the
    number of thresholds.

%%% ibuild!
1
```

(1) MultiplexBUT is a child of `MultiplexWU`, which in turn derives from `Graph`.

Code 10: **MultiplexBUT element prop update.** The `props_update` section of the generator code in `_MultiplexBUT.gen.m` updates the properties of `MultiplexBUT`. ← Code 2

```

PARTITIONS (result, rvector) returns the number of layers in the partitions
```

(1) calculates the graph OrdMxWU calling the parent `OrdMxWU`.

(2) Same as in notes (2), (3), and (4) of Code 10..

(3) constructs an ordinal muliplex binary undirected graph for each threshold.

(4) loops over the layers of `A_Wu` for each threshold.

(5) sets the layers constructed by binarizing `A_Wu` according to the present threshold on the diagonal of the supra-adjacency matrix.

(6) connects consecutive layers.

(7) does NOT connect NON-consecutive layers.

```
      of the graph.
